

DAY 2 — DESIGN SYSTEM COMPONENT & TICKET #1

Project: Career Navigator | **Feature Branch:** fix/EDTECH-402-quiz-submit-validation

Day 2 Objectives

The Day 2 work focused on building a reusable UI component in Storybook, creating a feature branch according to the required naming convention, and investigating a functional issue in the local application.

1. Isolated UI Component

A reusable **LearnerProgressBadge** component was created under **src/components/LearnerProgressBadge/**. The component was implemented with TypeScript and supports the required states: **Default, In-Progress, Completed, and Disabled**.

A dedicated Storybook story file was created for the component. After resolving an initial story indexing/default export issue, all component states successfully rendered and were verified in Storybook. The component was also checked in a mobile-sized viewport.

2. Feature Branch Setup

The local **main** branch was updated using **git pull origin main**, which confirmed that the branch was already up to date. The required feature branch was then used:

fix/EDTECH-402-quiz-submit-validation

3. Local Application Investigation

During local testing of the AI Career Navigator application, the onboarding flow was found to fail while creating a user profile. The failing request targeted **user_profiles** and returned an HTTP **404**, resulting in an **Error creating profile** message.

Relevant references were identified in **GetStartedModal.tsx**, **UserContext.tsx**, and the generated Supabase types. The investigation indicates that the application expects a **user_profiles** database resource that may be unavailable or incorrectly configured in the connected Supabase environment.

Summary

The Day 2 implementation successfully produced an isolated, typed, reusable learner component with all required states and verified Storybook rendering. The required feature branch was also created according to the provided naming convention. Local application testing additionally identified a profile creation issue involving the expected **user_profiles** Supabase resource.
