

DAY 1 — ARCHITECTURE & DIAGNOSTIC NOTE

AI Career Navigator • 19 August 2026

Scope. Local environment setup, build/tool diagnostics, and initial learner-flow inspection of the Vite/React application.

Environment & Build

- PASS — Repository cloned to D:\Projects\Career-Navigator; Node.js 20.15.0 configured; dependencies installed with npm ci.
- PASS — Local Vite/Supabase environment configured through .env.local; development server runs locally and the frontend loads.
- PASS — npm run build completed successfully in ~4.3 seconds.

Codebase Diagnostics

- TypeScript: PASS — npx tsc --noEmit completed with no compiler errors.
- ESLint: FAIL — 15 errors and 14 warnings, including empty-interface rules, unnecessary escapes in supabase/functions/analyze-resume/index.ts, a require() import in tailwind.config.ts, and React hook/Fast Refresh warnings.
- Tests: NOT VERIFIED — npm run test reports Missing script: "test"; no project test runner is configured in the repository.

Learner Flow Audit

- Homepage: PASS — UI loads; no critical runtime exception on initial refresh. Two non-blocking React Router future-flag warnings were observed.
- Profile creation: FAIL — Supabase request user_profiles?select=* returned HTTP 404, indicating the configured personal Supabase project does not yet expose the expected backend resource/schema.
- AI Resume Screening: FAIL — Resume analysis shows “API key required / Please enter your OpenAI API key in the dashboard,” blocking the analysis flow.
- Sentry: PASS — @sentry/react integrated and event delivery verified after resolving the browser blocking issue.

Architecture Observations

- Frontend: Vite + React + TypeScript with client-side routing and componentized UI.
- Backend integration: Supabase client and Supabase functions support data and AI workflows; Vite environment variables are consumed via import.meta.env and local configuration is kept in .env.local.

Open Actions

- Apply/verify the expected Supabase schema before re-testing profile creation; configure the OpenAI key through the intended backend/dashboard mechanism without exposing it in frontend source.
- Confirm the intended automated test setup with the Team Lead before adding a runner or changing dependency versions; review existing ESLint findings before making code changes.

Overall: Local build operational; Sentry diagnostics working; learner-flow and backend configuration blockers identified.
